Dictionary Service

Your task is to design a system which will satisfy the bellow-mentioned requirements and optimize it to the best of your abilities.

Requirements

The system should offer translation/dictionary services for the levels mentioned bellow:

- Sport
- Country
- League (Tournament)
- Team

API

The API should be divided in 2 sections
1. Client (reading)
     - List all (paginated)
     - List all by language (paginated)
     - Find by Id
     - Find by Id and language
2. Management
     - The Management section should offer the standard CRUD functionalities.

CSV

In addition to the standard management API the service should allow for importing translations using text files (.csv) which will be provided additionally.

The fields (from the .csv file) needed for implementation are the following:
- SportId
- CountryId
- TournamentId
- Sport
- Country
- Tournament
- TeamId
- TeamName

You can ignore the extra fields.

* I would suggest browsing the .csv file with a text editor like (Notepad ++/ Sublime) rather than Excel
